**Re: Traffic Statement
Subaru Head Quarters Traffic Calming
City of Camden, Camden County, New Jersey
Langan Project No.: 220140301**

Langan Engineering & Environmental Services (Langan) has prepared this traffic statement for the proposed internal driveway/security upgrades along Subaru Drive at the Subaru Head Quarters in Camden, NJ. Based on a meeting with city representatives we were asked to analyze whether the internal driveway modifications would impact the adjacent signalized intersections of 11th Street and Subaru Drive, 11th Street and Newton Avenue, and 11th Street and Memorial Avenue/Campbell Place.

In addition, based on a previous conceptual plan provided to the city, there were preliminary discussions about constructing an exclusive right-turn lane along 11th Street, however; as discussed below, we do not believe that an exclusive right-turn lane is necessary at this time.

PROPOSED DEVELOPMENT PROJECT

As part of the proposed improvements, Subaru Drive will be widened to provide an additional employee entrance lane that will be approximately 75 feet in length. In addition, the existing employee entrance lane will be extended by moving the gate access further into the site. Both employee entrance lanes will be equipped with gates and some type of card reader capabilities which will activate the gate to open and close for every employee passenger car entering the site. The visitor entrance lane will also be extended and will continue to operate with a gate and a security booth.

TRAFFIC OBSERVATIONS

Langان arranged for traffic counts to be conducted, utilizing MioVision video cameras, on Tuesday, October 3, 2023, from 6:00-10:00 AM and 3:00-6:00 PM at the three study area intersections. Utilizing the videos, we did a detailed observation at the intersection of 11th Street and Subaru Drive to determine existing operations. The traffic counts used for this traffic statement have been included as an attachment.

The eastbound approach along 11th Street consists of one exclusive left turn lane and one exclusive through lane. The westbound approach along 11th Street consists of one exclusive through lane and one shared through and right-turn lane. The southbound approach along Subaru Drive consists of one exclusive left-turn lane, and one exclusive right turn lane. The ingress to the site consists of one exclusive lane for the employees and one exclusive lane for visitors.

The existing traffic conditions along the eastbound and westbound approaches of 11th Street show some minimal queuing during the weekday morning and evening peak hours. When there was queuing along the westbound approach, it was more noticeable in the inner through lane as compared with the shared through/right-turn lane because of the vehicles staying in the left-most lane in anticipation of making a left-turn onto Newton Avenue at the adjacent intersection. There were times when the traffic flow was slow moving, however; the queue within the road segment dissipated within less than sixty seconds.

At the time of observation, the gate for the visitor's lane was fully operational and the gate for the employee lane was operating on a schedule. The employee gate was open (up) between 8:00 to about 8:50 AM, and employees were allowed to enter without stopping. We monitored the vehicle flow during the peak 15-minute window before the gates were raised open. Between 7:45 to 8:00 AM, our manual count shows a total of 66 employee vehicles and 10 visitor vehicles. Within this time, the maximum number of vehicles we observed per minute was 9 employees and 2 visitors. The operational rate of the gate from opening to closing was observed to be approximately 6 seconds. We observed that when two or more vehicles arrived within a short period, the gate stayed up to allow the vehicles through and did not close until no car was observed in the queue. There was one instance where the flow was stopped, and 4 vehicles were observed in the lane, however, all cars within the lane were able to go through within a minute.

Based on our manual traffic counts, we determined that the entering peak 15-minute volume was 99 vehicles from 8:30 to 8:45 AM, with a maximum of 11 employee vehicles arrived within a one-minute period. As previously mentioned, the gates were raised during this time and no queuing was observed. The entering peak hour volume was 316 vehicles from 7:45 to 8:45 AM. In general, approximately 29% of the entering trips are making the eastbound left-turn from 11th Street and approximately 72% of the entering trips are making the westbound right-turn from 11th Street. During the entering peak hour, 93 vehicles were from the west and 223 vehicles were from the east. During the entering peak 15-minute, 30 vehicles were from the west and 69 vehicles were from the east, and all vehicles during the peak entering minute came from the east.

QUEUEING ANALYSIS

Langan has performed a queue analysis to assess the adequacy of the proposed entrance for Subaru assuming that all employee entering vehicles will need to access through a security gate that will open and close for each individual car. Based on the latest concept plan, an additional employee lane will be constructed with a queue capacity of approximately three cars. To analyze the average length of queue and average waiting time per vehicle, we have utilized the M/M/N queueing theory, with the assumption that there will be random arrival and departure patterns and two gates operational during the peak hours.

At this time, we do not know the operational characteristics of the proposed gate, however; to be consistent with previous studies done, we conservatively estimated that the processing rate for the gate will be 8 seconds per passenger car (approximately 2 seconds for the gate to open, 4 seconds for the vehicle to clear the gate, and 2 seconds for the gate to close). Based on a review of the existing gate operations, the processing rate is currently about 6 seconds,

therefore, we are showing a conservative analysis as the processing rate may be faster than the 8 seconds analyzed. The results of the M/M/N queuing analysis are shown in the table below:

Gate Queue Analysis Table using M/M/N Queuing Model					
Time Period (Entering)	Trips (In)	Avg Service Rate (car/min)	Avg Arrival Rate (car/min/lane)	Avg Queue Length (car)	Avg Wait Time (sec)
AM Peak Hour	268	7.5	4.47	1	0.78
Entering Peak	316	7.5	5.27	1	1.12
Peak 15-minute	99	7.5	6.60	1	1.92
Peak 1-minute	11	0.13 car/sec	0.18 car/sec/ln	2	9.31

The entering peak hour volume was 316 between 7:45 to 8:45 AM. Utilizing this entering volume, it is projected that average wait time for each vehicle is about 1 second and the average queue length is 1 car per lane. The entering peak 15-minute volume was 99 employee vehicles and 2 visitor vehicles between 8:30 to 8:45 AM, with a recorded maximum of 11 vehicles arrival within a minute. For the peak 15-minute analysis, the projected average wait time for each vehicle is about 2 seconds and an average queue length of 1 car per lane. For the peak 1-minute analysis, the average wait time for each car is about 9 seconds and an average queue length of 2 cars per lane.

The current concept plan shows that the location of the security gate for the existing employee lane is proposed to be extended by about 65 feet, which is estimated to provide storage for approximately 7 vehicles. The proposed additional employee lane will be constructed to provide storage for approximately 3 vehicles. Based on the queuing analysis, with two employee gates operational, the entering employee vehicles will be processed efficiently with the potential for queuing that should not extend beyond the internal driveway storage that will be provided. The upstream and downstream platooning of vehicles, as provided by the traffic signals, allows a certain number of vehicles to enter the site at any give time. This allows for a constant flow of vehicles over the peak periods which provides an arrival pattern that can be processed by the proposed security gates with minimal interruption and backups.

CAPACITY ANALYSIS

We conducted capacity analyses for the existing conditions at the three study area intersections utilizing the Synchro software package. During the three peak hours analyzed, all intersections operate at acceptable overall level of service (LOS) C or better, with all specific movements operating at LOS D or better. The specific intersection of 11th Street and Subaru Drive operates at optimal overall LOS A during the weekday morning peak periods when the majority of employees are entering the site. The following tables show the corresponding levels of service and delay and the 95th percentile queues. The capacity analyses worksheets have been included as an attachment.

Based on a review of the analysis, there does not appear to be an operational need for an exclusive westbound right-turn lane along 11th Street at the intersection with Subaru Drive. As it stands, the signal timing and platooning of vehicles based on the existing conditions is accommodated within the existing geometry, and it is anticipated that operations will continue to be efficient after the installation of the safety upgrades/modifications along Subaru Drive.

CONCLUSION

Langan has concluded that the proposed internal driveway/security upgrades along Subaru Drive at the Subaru Head Quarters can be constructed with no noticeable impacts to the intersection of 11th Street and Subaru Drive or the adjacent intersections of 11th Street and Newton Avenue and 11th Street and Memorial Avenue/Campbell Place. Based on the queuing analyses, we determined that with the proposed second employee entrance lane (and with the gates being always operational), that the queue length will average approximately 1-2 vehicles for each lane during the peak entering times. The employee passenger vehicle queues are expected to be accommodated within the proposed available storage lengths for each lane.

The proposed construction of an additional employee lane, along with the relocation of the security gates to accommodate more storage, will provide efficient entrance operations and vehicular traffic flow during the peak periods. We recommend retaining the existing lane configurations at the adjacent study area intersections.

Queue Length 50th (ft)	21	89	0	4	163			75	1		9	
Queue Length 95th (ft)	49	267	0	14	251			133	47		35	
Internal Link Dist (ft)		239			502			172			526	

Lane Group	EBL	EBT	EBR	WBL	WBT	WBR	NBL	NBT	NBR	SBL	SBT	SBR
Turn Bay Length (ft)	125		125	150					40			
Base Capacity (vph)	390	1096	1020	657	1778			448	491		366	
Starvation Cap Reductn	0	503	0	0	0			0	0		0	
Spillback Cap Reductn	0	0	0	0	0			0	0		0	
Storage Cap Reductn	0	0	0	0	0			0	0		0	
Reduced v/c Ratio	0.35	0.79	0.01	0.04	0.54			0.34	0.28		0.10	

Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 81.9

Natural Cycle: 60

Control Type: Semi Act-Uncoord

Maximum v/c Ratio: 0.57

Intersection Signal Delay (s/veh): 16.4

Intersection LOS: B

Intersection Capacity Utilization 63.8%

ICU Level of Service B

Analysis Period (min) 15

Splits and Phases: 3: Campbell Pl/Memorial Ave & 11th St
